

## JS Methods

• Map()

Say you received an array containing multiple objects - each one representing a person. The element you really need at the end, though, is an array containing the only the id of each person.

// what we have

let skaters = [

{ id: 23, name: 'Nyla Huston' }

]

// what I want

[23]

You might want to do it by creating an empty array, then using .forEach(), .for (...of), or a simple .for() to meet your goal.

Using .forEach() - usually used in place of a standard for loop statement

let skaterId = []

skaters.forEach(skater => {

skaterId.push(skater.id);

})

skaterId = skaters.map(skater => skater.id);

Notice 'skater' is just value/variable we created
